Fractions: 0-4, 0-7, 0-20, 7-20, 20-40, 0-40, 20-60.

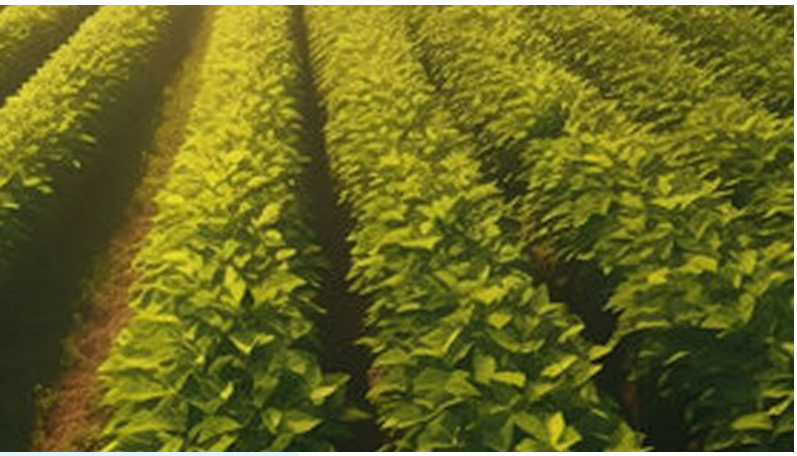
SkyPeat

APPLICATION OF SkyPeat Substrate

The high quality of the SkyPeat substrate allows to create ideal conditions for the growth and development of plants. SkyPeat substrate is made from high quality peat. SkyPeat is used for growing seedlings of various crops.

The peat substrate regulates the growth and development of plants at the initial stages, prevents and eliminates nutrient deficiencies, and affects the growth processes of the aerial and root parts of the plant.

Vegetable Crops



Flower Crops

Seeding

Mushroom Growers

Our portfolio serves the widest range of areas in the “green sector”; from hobby gardeners through to professional horticulturalists. Just natural peat moss or even special substrates or planter pots. With our name and our mission statement ‘’Your plants in good hands’’, we stand for innovative spirit, top products, customer orientation and gapless logistics.

Properties of the peat substrate – SkyPeat

All SkyPeat substrates are treated with a water-retaining agent that increases the hygroscopicity of the peat and improves water absorption. SkyPeat substrates do not require the addition of lime and are free of weed seeds and pathogens. Due to the high compaction factor of SkyPeat when packed, the bale is compact and contains the maximum volume of the substrate itself.
